

# CS236 HW6 – Teng Xu

- 1) (2 pts) Solve  $3p+11 \equiv 23 \pmod{26}$  using subtraction and division of congruence by a number. Why are you allowed to do this?

Hw 6

17.  $3p + 11 \equiv 23 \pmod{26}$  Reason: If  $a \equiv b \pmod{m}$  holds then  $c+a \equiv c+b \pmod{m}$

$3p \equiv 12 \pmod{26}$

Inverse of 3 mod 26:

$26 = 8 \times 3 + 2$   
 $3 = 2 + 1$   
 $2 = 2 \times 1 + 0$   
 $3 - 2 = 1$   
 $3 - (26 - 8 \times 3) = 1$   
 $-26 + 9 \times 3 = 1$   
 $\therefore \text{inverse} = 9$

$3p \cdot 9 \equiv 12 \cdot 9 \pmod{26}$   
 $p \equiv 108 \pmod{26}$   
 $p \equiv 4 \pmod{26}$   
 $p = 4$

Reason: If  $a \equiv b \pmod{m}$ , then  $c \cdot a \equiv c \cdot b \pmod{m}$   
 $a \cdot \bar{a} \equiv 1 \pmod{m}$

- 2) (2 pts) Write a function `extendedGcd(a,b)` returning gcd and Bézout coefficients of a and b, using extended Euclidian algorithm outlined on slides 31, 34 of Lecture 5. Test it on `gcd(5,26)`, `gcd(10,26)`, `gcd(13,26)`, `gcd(26,36)`, `gcd(24,36)`.

In [22]: `extendedGcd(5,26)`

Out[22]: (1, -5, 1)

In [23]: `extendedGcd(10,26)`

Out[23]: (2, -5, 2)

In [24]: `extendedGcd(13,26)`

Out[24]: (13, 1, 2)

In [25]: `extendedGcd(26,36)`

Out[25]: (2, 7, -5)

In [26]: `extendedGcd(24,36)`

Out[26]: (12, -1, 1)

- 3) (2 pts) Is it possible for a multiplicative inverse modulo m to be 0? Under what condition does multiplicative inverse of a modulo m exist? Write a function returning `multInverse(a,m)` that checks existence of a multiplicative inverse of a modulo m, and if it exists - returns it (otherwise return 0 and print the message: "multiplicative inverse does not exist").

In [57]: `multInverse(3,7)`

Out[57]: -2

In [58]: `multInverse(7,26)`

Out[58]: -11

- 4) (2 pts) Write a function `encryptAffine(letter, a,b)` that uses encryption function  $f(p) = ap + b \pmod{26}$  and `decryptAffine(letter, a,b)` that uses corresponding decryption function. Check that encryption function is a bijection, otherwise – output error message. Test your functions on the results of problem 3 for HW5, and encrypting and decrypting back messages: “cryptography is based on modular arithmetic”

```
In [71]: encryptAffine('a', 5,3)
```

```
Out[71]: 'd'
```

```
In [72]: encryptAffine('b', 5,3)
```

```
Out[72]: 'i'
```

```
In [73]: encryptAffine('c', 5,3)
```

```
Out[73]: 'n'
```

```
In [19]: encryptAffine('cryptography is based on modular arithmetic',5,3)
```

```
Out[19]: 'nktavhkdamt rp idpxs vq lvszgdg dkruumlurn'
```

```
In [20]: decryptAffine('nktavhkdamt rp idpxs vq lvszgdg dkruumlurn',5,3)
```

```
Out[20]: 'cryptography is based on modular arithmetic'
```

5.6.7 :

5). GRIZZ LYBEA RSXXX  
3 5 1 2 4 3 5 1 2 4 3 5 1 2 4  
IZGZR BELAY XXRXS

6). EABW EFRO ATMR ASIN  
2 4 1 3 2 4 1 3 2 4 1 3 2 4 1 3  
BEWA REOF MART IANS

7).

5:  $\sigma(1) \rightarrow 2, \sigma(2) \rightarrow 4, \sigma(3) \rightarrow 1, \sigma(4) \rightarrow 5, \sigma(5) \rightarrow 3$

6:  $\sigma(1) \rightarrow 2, \sigma(2) \rightarrow 4, \sigma(3) \rightarrow 1, \sigma(4) \rightarrow 5, \sigma(5) \rightarrow 3$

They are all permutations because they are one to one and onto
